The 3 B's

**In multi-unit buildings, power flows
but information doesn't.**

Blind Charging

In shared apartment chargers, residents plug in without context.

They can't see when power is cheapest, greenest, or when chargers will be free — they just charge and hope.

Bottlenecked Infrastructure

Shared car parks with one or two chargers can't meet growing demand.

As EV ownership rises, residents face queues, disputes, and wasted energy.

Broken feedback

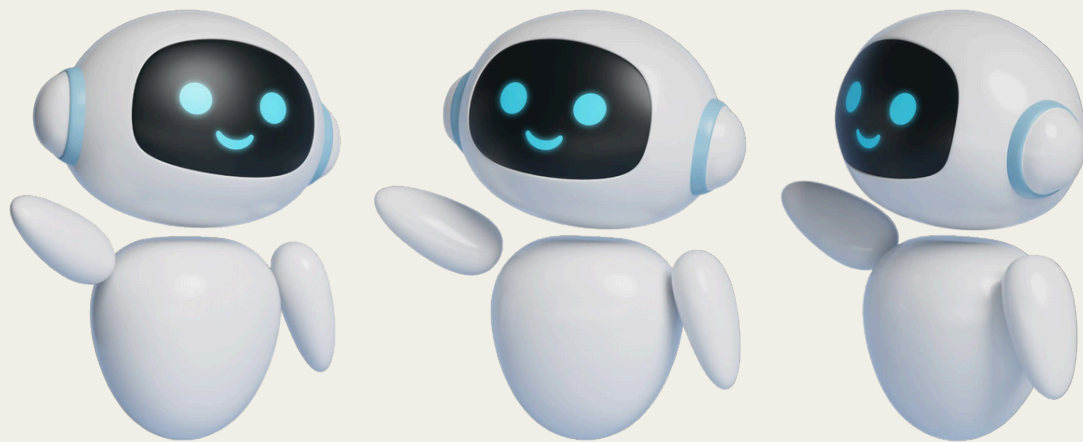

Over 80% of households want to cut energy use — but apartment systems give no means to do so.

The will exists, but the system doesn't.

Compounding!

The 1 Solution

Agona turns shared energy into shared intelligence.

Personal Agents

Each resident's AI agent learns their routine and EV habits.

Community Agent

A shared building agent communicates with all personal agents.

Feedback & Fairness

Together, the agents track overall demand and fairness — generating insights that help optimise usage, reduce conflict.

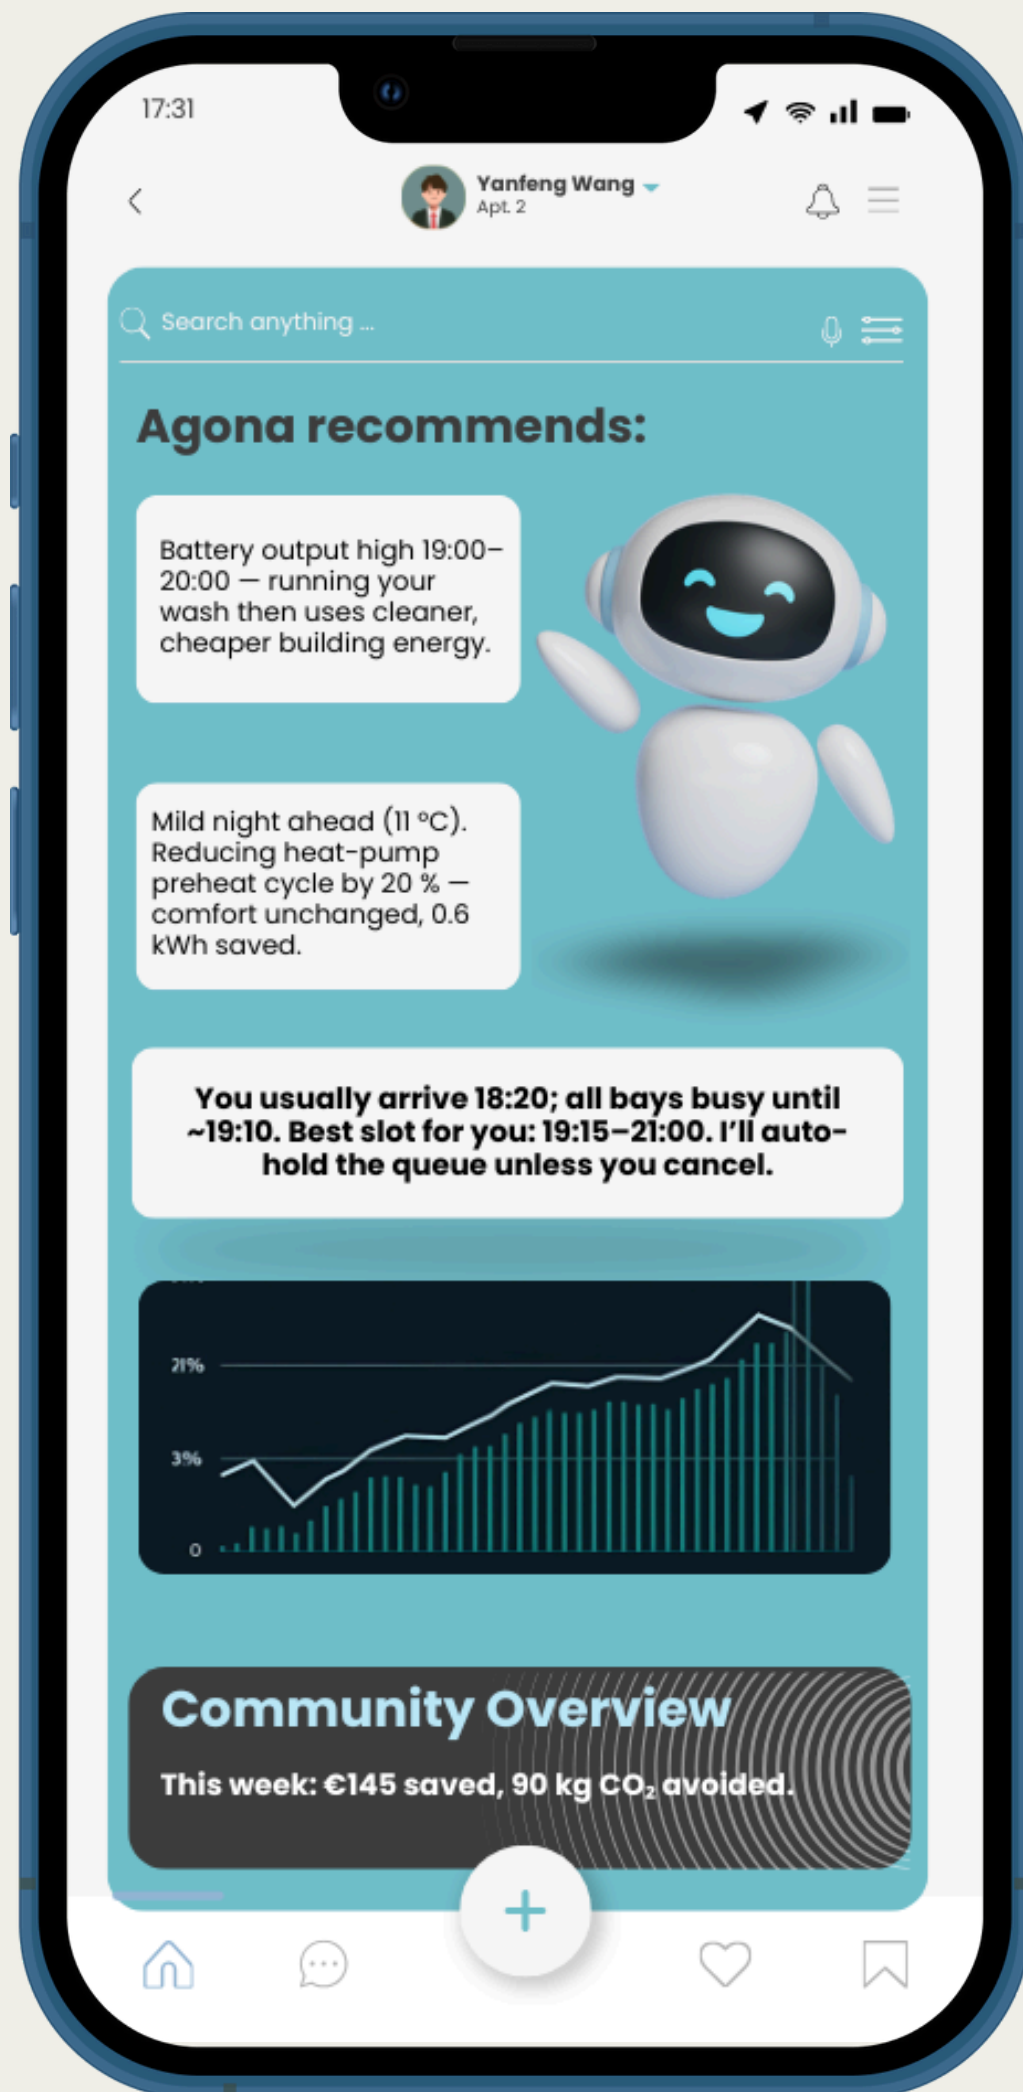

Today's Capabilities

5

Data sources: Smart meters, Charger backend, weather & price forecasts, User inputs & app interactions

What the Agent Learns	How the Resident Benefits
Your typical charging times (when you plug in, when you leave)	“Low demand expected 8–10 pm — chargers likely free.”
Your average charge size (kWh)	“You’ll reach 75 % by 7:45 am.”
Your flexibility	“Shifted your slot to 9 pm for shorter queue — cancel anytime.”
Your daily & weekly routine	“You usually charge Mondays and Thursdays; pre-booked for tonight.”

The Bigger Picture

The more technology a building adds, the more valuable Agona becomes.

Agona begins with EV.

As solar panels, batteries, smart heating, and dynamic pricing roll out, Agona's intelligence layer helps residents use and benefit from them in the smartest, most coordinated way.

Business Model

A scalable, subscription software.

Who pays

Owners' Management Companies and property developers.

What they pay for

AI Software-as-a-Service model licensed per complex on an annual subscription (€2-4k).

One-off integration fee when connecting existing systems such as solar PV or EV chargers.

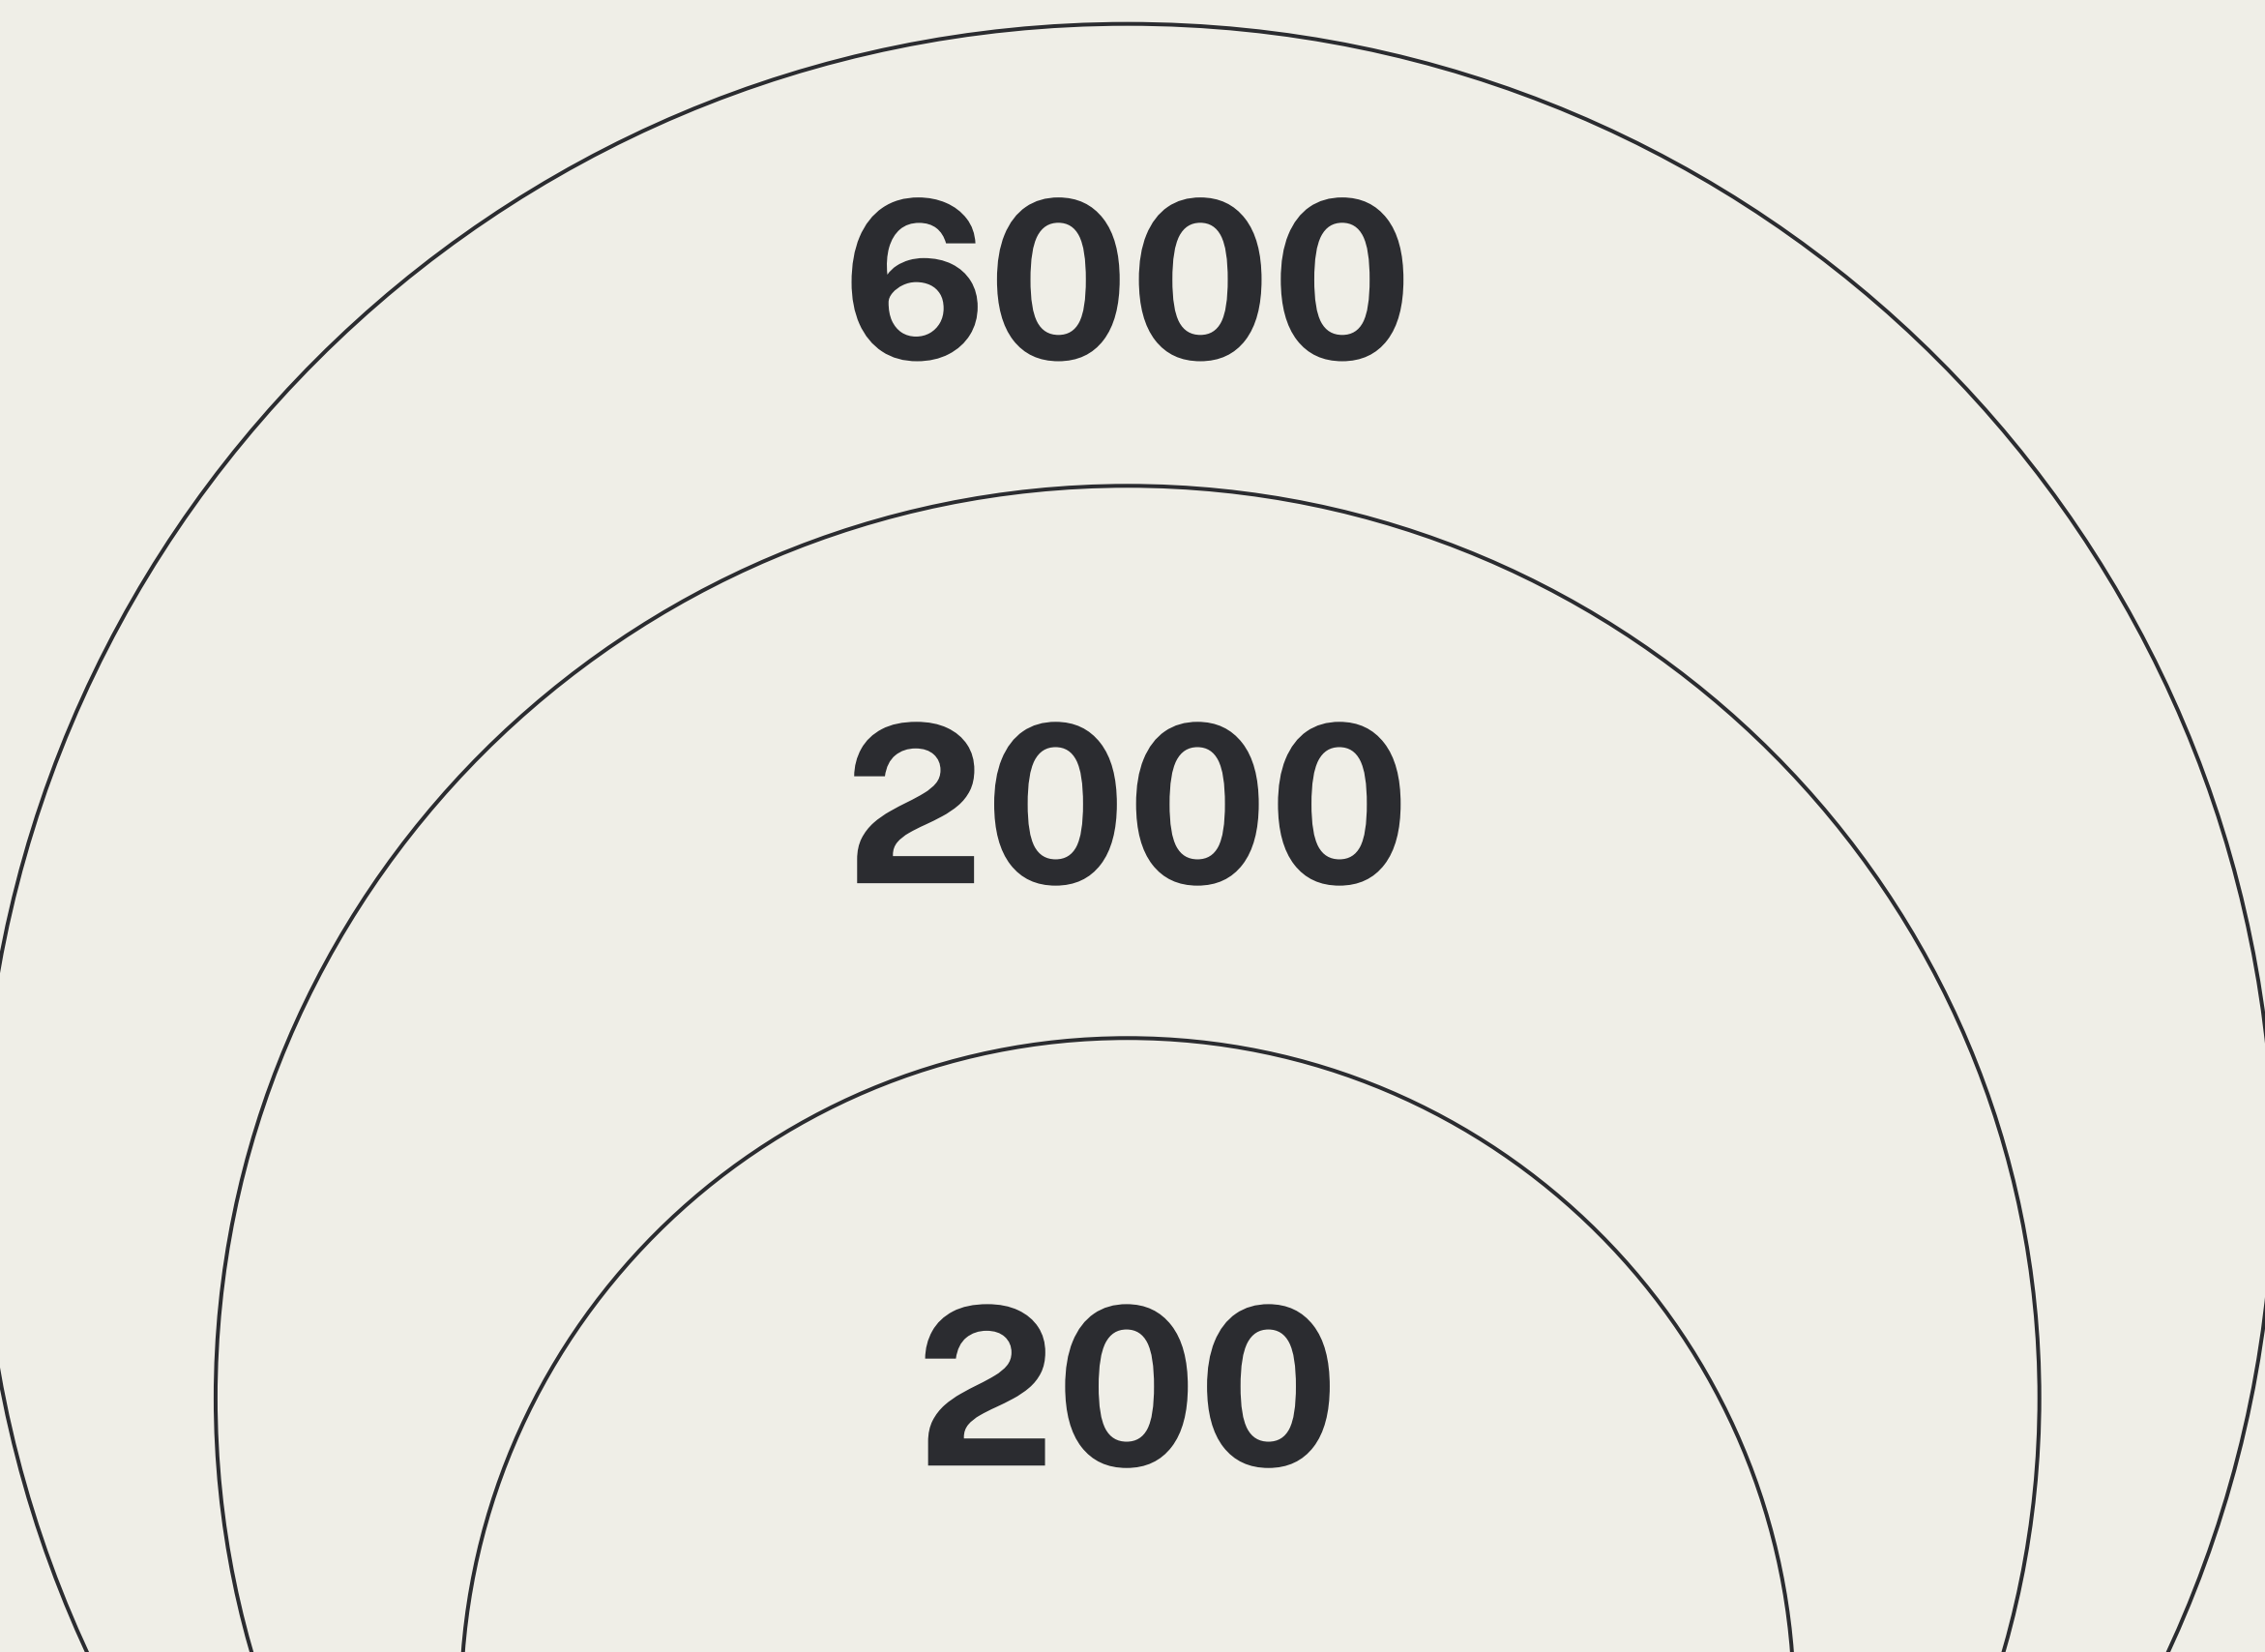

How it scales

Software-intensive, not hardware-heavy.

Scaling to new complexes is fast and repeatable through standard APIs and templates.

Market Size

6000

2000

200

Total Addressable Market

≈ 6 000 multi-unit developments (≈ 300 000 dwellings)

Serviceable Available Market

Assume $\frac{1}{3}$ will develop mature EV-charging and other renewable systems within five years of product rollout.

Serviceable Obtainable Market

≈ 200 developments (≈ 5%) targeted as early adopters in the initial phase.

Impact

Assumptions

- Assume 100 apartments + 10 shared EV chargers (max ≈ 6 active at once).
 - Typical communal + EV energy bill: $\approx$ €70k/yr
 - ESB capacity charge: $\sim$ €120/kVA·yr for declared Maximum Import Capacity.
 - If current peak load is 120 kW $\rightarrow$ MIC = 130 kVA $\rightarrow$ €15 600 / yr cost.
 - **Agona coordination smooths charging peaks (~15 % reduction).**
 - $\rightarrow$ MIC drops $\approx$ 20 kVA $\rightarrow$ **€2 400 saved / yr.**
 - Lower standby losses: $\approx$ €300 / yr.
 - Reduced maintenance $\approx$ €1 000 / yr.
 - Simpler admin & fewer complaints: $\approx$ €1 000 / yr.
- $\rightarrow$ **Total indicative saving: $\approx$ €5 000/yr**

Set initial annual subscription fee to € 2000

Finances

Assumptions

- Annual subscription: €2k
- One-off integration fee: €1k
- Target: 200 devs in 5 years

Returns

- Year 5 annual turnover $\approx$ €480k
- Total revenue $\approx$ €1 million

Year	Devs	Subscriptions	Integration
1	5	€10000	€5,000
2	20	€40,000	€15,000
3	60	€120,000	€40,000
4	120	€24,0000	€60,000
5	200	€400,000	€80,000

- 4-person team in Years 1–2, 6 by Year 5
- Subscriptions double Year 5 = Breakeven in Year 5
- **Seeking €750k investment for a 15% equity share**

Feature	Agona	Monta	Octopus Energy	Schneider ExoStructure

Explainable recommendations	✓	✗	✓	✗
Resident-facing app	✓	✓	✓	✗

Competitors

Combines what others separate

- Dual-layer AI: personal + community.
- Fairness and autonomy built-in.
- Scales naturally — EVs today, storage tomorrow.

Roadmap

Phase 1

Develop the core agent system. Pilot in a small number of apartment developments to prove savings and usability.

Phase 3

Deploy commercial version with early-adopter OMCs.

Phase 2

Integrate with leading EV-charging networks and solar APIs.

Phase 4

Expand via property-management partners.
Add support for storage and dynamic tariffs.

Thank you!

Shared Energy. Personal Power.
